Potential competing interests: No potential competing interests to declare.

Please see the relationship between herd size and subclinical and clinical mastitis. You describe herd size in the material, but you don't use this.

You can benefit from the article "The effect of year, month, region, and herd size on bulk tank somatic cell and standard plate count, and the determination of optimum herd size in the intensive Holstein dairy farms in the Turkish Republic of Cyprus".

<https://journals.tubitak.gov.tr/veterinary/vol44/iss6/10/>

Describe the factor you defined as farm hygienic status in Table 3 in the Materials and Methods. What is farm hygienic status?

The introduction is too long, and the objective of the research is not defined. After all, what will the prevalence or non-prevalence of Staphylococcus aureus change in the management of farms? What needs to be done?

Please evaluate in terms of herd management.
