In this article, a study was carried out for the western region of Esna for April and May of 2021 before the installation of the meters and the year 2022 after the installation. The total water production for western Isna in April 2022 = 1956020 cubic meters. Among them, the productivity account was reduced to around 7% in April. Total water production for Western Isna in May 2021 = 2,120,272 cubic meters. Total water production for western Isna in May 2022 = 1,834,355 cubic meters. Among them, the productivity account was reduced to around 13% in May. This is reflected in the calculation of the percentage of losses and unaccounted water, and these calculations will be more accurate after installing the devices and operating the SCADA system better than calculating them before. The article is well written and well formulated with new contributions.
