

Review of: "The Influence of Hot Extrusion on The Mechanical and Wear Properties of an Al6063 Metal Matrix Composite Reinforced With Silicon Carbide Particulates"

Shima Pashangeh

Potential competing interests: No potential competing interests to declare.

The abstract is, overall, more details about results should be put on it.

The introduction part needs to be modified, especially the first paragraph, which needs to be rewritten and improved in quality by adding some scientific knowledge to this part.

I believe the authors should investigate the microstructure of the produced composites before conducting and reporting the mechanical test results. As we know, there is a direct relationship between microstructures and the properties of alloys and materials.

The quality of the images is too low. The image quality needs to improve.
