Potential competing interests: No potential competing interests to declare.

- Limitation could affect the generalizability of the findings since healthcare systems, patient demographics, and COVID-19 management strategies vary across countries.
- The paper briefly mentions the age and gender of patients but could benefit from a more in-depth exploration of how these factors influence stroke risk in COVID-19 patients. A detailed analysis of age stratification and gender differences in outcomes could provide insights into vulnerability and risk.
- The focus on specific comorbidities (like diabetes and hypertension) may overlook other potential factors, such as mental health conditions or social determinants of health, that can also play a role in stroke incidence in COVID-19 patients.
