

Review of: "[Review Article] Excessive Aluminum in Soil"

Xiaoxia Zhang

Potential competing interests: No potential competing interests to declare.

This manuscript focused on sources of aluminum contamination, health risks associated with exposure, assessment methods, and remediation strategies. The logical organization of the article is also very good. It is pivotal for sustainable agricultural management, and the word is easily read. However, this paper still has some work to do before being accepted.

The abstract is not well written. Each sentence needs to be coherent.

The explanation of each section is relatively simple, without in-depth exploration and citation. In addition, the cited literature is relatively outdated and lacks literature from recent years. Finally, the number of citations in the literature is too small.
