The authors describe the Corona viruses in wild canids in this comprehensive review. Overall, the article is well written and comprehends the spread of corona virus across various canids. In addition, it is well concluded that a one health approach needs to be endorsed in order to combat this infectious agent. However, the details with regard to the spill over and spill back of such infections, that too, when this virus has created a pandemicity has not been narrated adequately among wild canids, while viewing through the one health lens. In this regard, this area provides further research potential to work in a public health perspective.
