Dear authors,

Thank you for the opportunity to review the Italian Position Paper on MRONJ.

The manuscript is complete and includes epidemiology, diagnosis and treatment of MRONJ and providing useful algorithms for the dental management of patients at increased MRONJ risk and for the treatment of this pathology.

It would be interesting to incorporate a table including all high-risk medications

My personal opinion is that surgical techniques are sometimes invasived in BP-ONJ (Table 7a). In this case, surgical reconstruction is a challenge, particularly in oncology. The general condition of the patients is altered and the entire bone tissue is impregnated by bisphosphonates. The risk of failure is increased and we must be careful not to alter the quality of life of patient.
