Dear Authors,

I was pleased to review the paper entitled "Bisphosphonate-Related Osteonecrosis of the Jaws Treated with Platelet-Rich Plasma: Preliminary Results from a Case Series".

I found the topic of the paper very interesting, well-written and organized. However, I suggest a few adjustments:

- In the abstract section, keywords should be inserted to facilitate the search of readers. the keywords you can choose as indicated in the Author Instruction of the European Review for Medical and Pharmacological Sciences.
- The discussion and conclusions are balanced and well supported by analysis; the limits of the study are missing. The limitation of the study is the low number of patients enrolled and the absence of a control group. In the future, a comparison could be made between the two groups.
- To support the selection of patients enrolled in the study, it is recommended to specify the inclusion and exclusion criteria for choosing patients.
- Check the Reference section according to author guidelines. Moreover, I found some of them to be a bit dated, I suggest therefore looking for more recent works as a topic on the use of Platelet-Rich Plasma. For this reason, I propose this interesting work: " Moretti, L.; Maccagnano, G.; Coviello, M.; Cassano, G.D.; Franchini, A.; Laneve, A.; Moretti, B. Platelet Rich Plasma Injections for Knee Osteoarthritis Treatment: A Prospective Clinical Study. J. Clin. Med. 2022, 11, 2640. <https://doi.org/10.3390/jcm11092640>"
- The format of the figures should be agreed with the guidelines of the magazine.

Overall is work well done, but there are mistakes in grammar and dotting, as words are miswritten (for example "favor" or "anesthesia"). There are double spaces to be eliminated in the writing of the manuscript.

Dear Author, the scientific work is very interesting, and the topic is extremely important, but there are a few revisions.
