This research is a good one and well written. It has a good contribution to knowledge. The following minor corrections need to be addressed.

1. In the abstract, mention what you used as the negative control.
2. The modifications you made in the methods like acute toxicity test should be stated.
3. In the hematological and biochemical parameter tests, collapse together the results of all the treatments that are not significant and those that are significant instead of one by one. For example, the mean total protein, albumin level, total bilirubin, direct bilirubin, etc. were not significantly different from the treated groups. There is no need quoting the p-values when the result is non-significant. Only quote the p-values when the result is significant.
