Potential competing interests: No potential competing interests to declare.

This study estimates the greenhouse gases (GHGs) emissions from cotton growing (production) in Central Greece using the Cool Farm Tool (CFT). CTF is a web-based simple, but scientifically robust carbon accounting tool. The tool provides quantified estimations that are based on the Intergovernmental Panel on Climate Change (IPCC) guidelines. The article is well written with some minor change suggestions, which I have indicated on attached as supplementary data.
