Potential competing interests: No potential competing interests to declare.

The article aims to discuss the importance of ethical contents in the training of the engineering curricula and provides a comprehensive overview of the importance of ethics in the context of engineering. For my point of view, it is difficult to understand the type of the article; is it a review article or a research article? The structure of the paper needs to be revised. Current and desired scenario are the subtopics of introduction, but both can be only introduction together with the aim and objective of the research paper. Pedagogical part is missing, methodology part needs to be restructured. In a manuscript instead of having a separate literature survey section, it can be adapted to introduction and discussion.
