The author of the manuscript: **Arshad Bhat**

"With Greetings"

Article title: **Comparative Analysis of Sustainable Livestock Development as a Source of Livelihood to Farmers of Maharashtra and Jammu and Kashmir**

In my opinion, the quantitative and qualitative evaluation of the manuscript is as follows:

A- The author's manuscript title is very appropriate. The selected components of the manuscript title correspond to the text.

B- Abstract: This section is not acceptable due to the shortcomings of the main components (context and purpose, to the conclusion). The respected author of the article should make this important section complete and attractive.

C- Keywords are somewhat acceptable.

1- Introduction: This section of the manuscript is very important because the author could not recount the scientific literature of the background of the knowledge process of the research target society (two states of India).

1- 1- The introduction section of the research should have appropriate and new referencing; the author has acted poorly in this regard. For example, this type of referencing in the introduction text (Livestock Census, 2019) is scientifically incorrect due to the incompleteness of the source.

1- 2- The introduction of the research does not have procedural subsections; the author has not managed the information and statistical tables that should have been used as materials and methods.

2 - The arrangement of the tables is not well managed; the author could have used information sources as materials and methods for analyzing the results and discussion, but this practice was not followed by the respected author.

3- In this research effort, due to the lack of research results and discussion, the conclusion will lose its quality; this procedure has not been followed in this research.

4- Conclusion and future strategy, although this part has been managed by the researcher based on experience and statistical data and it can be scientific to some extent, this action of the researcher is not a proper method.

Finally, it is recommended to the respected author that with this provided statistical information, she can change the structure of her manuscript with the necessary commands and get the desired results.

“Best regards”

Seyyed Akbar Sadaty, PhD, the first strategic multidisciplinary researcher within the (SMM) process in agricultural water and soil in the world, Islamic Azad University, IRAN. (COPDSIRAN).
