Potential competing interests: No potential competing interests to declare.

The authors have demonstrated the positive anti-inflammatory properties of aloe vera gel in reducing the incidence of phlebitis during catheterization. I have a few questions for the author of the text:

- In the **methods** section, after the first sentence, it says "they got" - what exactly does this refer to?
- In the text, you mention that **Table 4** represents the frequency of phlebitis; is this a mistake considering that only Table 1 is shown in the paper?
- What do you mean by "cc of aloe vera and 2% chlorhexidine gel"?
- You sometimes refer to it as a 2% chlorhexidine gel and other times as a 2% chlorhexidine solution—what was actually used?

Thank you,

Sanja B. Kuzman
