Potential competing interests: No potential competing interests to declare.

This article needs improvement to be reviewed.

1. Authors should provide clear evidence for their main argument that Dengue patients were misdiagnosed as malaria or typhoid fever.
2. There are several places where the numbers do not match. One of the examples is the following. The authors said the total patient number was 1074, then the malaria-positive cases were 741, and the typhoid-positive cases were 333. The added numbers became 1047.
3. More concise and clear data presentation is needed. Some of the data looks redundant.
4. References for the critical arguments need to be strengthened.
