Comments on " Solving Pallet loading Problem with Real-World Constraints":

I have read this paper, and appreciate the authors' great effort in the work. The following suggestions and major concerns may help the authors to improve their work.

- 1- In my opinion, the contribution of the research should be highlighted. What contribution do authors have in the modeling?
- 2- The references are old and new papers related to recent years have been ignored. Also, the literature review should be expanded and a comparison between the previous studies and the current work should be provided. For this purpose, authors can provide a table and some explanations in the text to depict the advantages of their work.
- 3- It is better to add some explanations about the structure of the research at the end of the literature review.
- 4- How did you conclude that your proposed algorithm is the best? How did you find out that a better algorithm than yours has not been presented up to now?
- 5- You claimed that the model is NP-hard, but you did not provide any evidence for this claim!
- 6- The findings and managerial insights cannot be seen in the paper.
