Potential competing interests: No potential competing interests to declare.

I thoroughly enjoyed reviewing this manuscript, and it is suitable for publication.

However, it would be better to improve the manuscript.

1. In Materials and Methods, the data and experiment cases should be shown in a table, and the formulas should be defined in variable equations.
2. The manuscript used a method based on the concept of the so-called predictive analogy. The authors should have collected and critically analyzed multiple research studies on the comparison of results to identify the impact of the proposed theorem.
3. It would be nice to add an application and provide new information.
