This review article in my opinion is satisfactory to be published in Qeios, after a few recommendations:

- Spelling and syntax correction of manuscript
- Multimodal analgesia must include a regional block since the beginning of severe pain, to reduce opioid-related side effects in old patients, mainly delirium .
- Consider to add a new emerging regional technique in the pain management options for hip fracture, for example, PENG block. There are new articles in the last 3 years for this option in addition to fascia iliaca or femoral block.
- Consider to add IV PCA modality for opioid management of hip fracture when describing systemic analgesia.

Thanks for allow me to participate in the review of this manuscript.
