With reference to your mail, I have gone through the research paper thoroughly and hereby giving you my reviews as followings:

1. The Author has selected a very good and important topic that can be regarded as need of the hour. The author had followed good methodology to find out the results.
2. In the study area map, the Author should give the coordinate detail i.e. latitudinal and longitudinal extension with degree and minutes, as coordinated are essential part of cartography.
3. It has been observed that the Author did not mention the size of the study area e.g. square kilometer.
4. The Author should mention the total numbers of schools existed in the study area. without knowing that, how would you define that Four numbers of samples (school) are sufficient to represent the problems. If the total numbers of schools would be known to the author, then the author must mention the percentage of samples with reference to the total numbers of schools.
5. The methodology and procedures to find out the results, sampling types etc. are good enough for the said study.

With the mentioned modifications, the paper may be processed for publication.

Thank You.
