Potential competing interests: No potential competing interests to declare.

The study was done to understand the knowledge of P&PFAS as critical emerging environmental issues and was conducted with questionnaires administered in the Abuja Metropolis.

The research did not show empirical studies on the health impact on the populace. In addition, the questionnaires used in the study were not made available as attachments that could show subjective rationale to answer the critical aspects of your research.

Also, there was no relationship to other locations within Nigeria and beyond on the impact of PFAS utilization and government relations or policies that guide the use, manufacturing, distribution, and management of these products that have significant health and ecological impacts.

Also, you need to use statistical tools such as ANOVA/significance assessment to discuss further the insights of this study and how they can influence future studies.

Thanks, and I await a reviewed work at your earliest convenience.
