## Feedback

Thank you for a relevant study. Diabetes continues to affect millions of people globally. Methods of prevention, treatment, and management of patients with type 2 diabetes remain fundamental in addressing this public health problem.

In this cross-sectional study, participants were selected based on inclusion criteria to evaluate the Diabetes Risk Score Tool for detecting undiagnosed Type 2 diabetes.

The study design is appropriate to answer the research questions.

The presentation of the work is clear.

The methods described lack information regarding the validation and reliability of the adapted DRS questionnaire. It is also unclear whether the author of the original questionnaire gave permission for adaptation. Please provide information on the pilot study and whether data collected in the pilot study was included in the main study. Can the researcher indicate when the study was conducted and who collected the data?

Please clarify the points on the questionnaire regarding low, moderate, and high risk. This is unclear.
