Snus

Addiction Ontology

Source

Addiction Ontology

Definition: Oral snuff in which tobacco, moisturizers, sodium carbonate, salt (sodium chloride), sweeteners and flavourings are mixed to form a moist product, resulting in very low concentrations of tobacco-specific nitrosamines.

Comment: Snus is usually flavoured, but not always. Use usually results in blood nicotine concentrations at least as high as smoking tobacco. They often come in permeable pouches. It is commercially prepared and is consumed by holding in the mouth for 30 minutes or more and does not require chewing, sucking or spitting.

This definition was imported from the Addiction Ontology (see <https://addictovocab.org/>). Comments and suggestions for improvements are welcome using the Qeios review system.

Definitions imported from the Addiction Ontology (AddictO) are what are known as 'ontological definitions'. See this article in Qeios for an explanation <https://www.qeios.com/read/YGIF9B>.

Ontological definitions can sometimes be hard to read. In those cases we also include an informal definition.

Definitions also often require elaboration to make it clear how they should be used and what they include. In those cases we include a comment.

Also, definitions sometimes require an explanation as to how they came about to help users understand how they relate to alternative definitions. In those cases we include a curator note.
