Dear Author,

the theme of your work is very interesting and deals with a topic, Biodiversity, that is very much in the spotlight today! It is important that this vision of positive human (voluntary and involuntary) activity is shared as much as possible in the various sectors of agriculture, forestry sciences and animal breeding because after a long period of selection and diversification of species, ecotypes and varieties, today large-scale distribution and policies directs us towards way to choose less and less variety of food, standardizing our preferences.

I quite share this vision even if I believe that human selection has been very different from natural selection, having led many species to be incapable of surviving in nature without aids (exactly the opposite of what natural selection does).

As regard the text, I particularly advise you to review to correct some spelling errors, commas as comma separators and above all to standardize the bibliography (some publication data are in brackets, others not for example)
