Potential competing interests: No potential competing interests to declare.

The paper presents a study on the analysis of the vulnerability of disasters based on the Structure, Resource, and Behaviour Changes (SRAB) model. The results are interesting and constitute an intermediate step for future research. However, there are some issues needed to be clarified, and the following are the detailed comments:

1 In this paper, disaster vulnerability has three steps: structural changes, resource changes, and behaviour changes. But, what's the definitions or contents of the three changes are not clarified.

2 The study interviews 21 different stakeholders, according to the proposed vulnerability's progression in this paper, it's better to discuss the relationship among the agricultural crop planting characteristics, whether the respondents have received government subsidies or not, and their behaviour when facing disasters.

3 To better understand the behaviour of the respondents, some descriptions of the respondents are needed.

4 The authors have collected many data in this study, to better analyze the data, maybe some data-driven models can be adopted.

5 In the conclusion section. It's better to discuss the limitation of the study or the scientific significance of the study.
