Dear colleagues,

In this manuscript, the authors demonstrate determine the histopathological pattern of cervical cancer among females in Uganda with 120 patients from 2017-2021. The results are interesting and support idea about influence of HIV for cervical cancer development. Despite the very good impression of the article, there are some questions which could improve the article in my opinion, partly:

There is any data about contamination of cervix with HPV in detected cases.

Conclusions should be supported more digital results.

In summary, I have been satisfied with the good level of the article. I believe this manuscript will attract attention from the research community both pathologists and gynaecologists. In my personal opinion, the article is valuable, a prospect for further research, and, after minor corrections, can be recommended for publication in the Qeios.
