**Potential competing interests:** No potential competing interests to declare.

Existing studies support your hypothesis. However, I still have my doubts. Many studies have been designed according to testosterone levels. There are studies indicating that mortality is higher when testosterone is low. However, it is also known that testosterone decreases with age and morbidities increase. It would be more accurate to conduct prospective studies after eliminating morbid factors. However, the available data support your study. Therefore, I accept the article and wish you success.
