Dear author, the article is very useful and a lot of work has been done. I have some suggestions to complete it:

- According to the statistical population (n=619), it seems that the sampling was done as a census.
- In the methodology, it is mentioned that the continuous score of metabolic syndrome is calculated, but in the results, it is reported according to the number of metabolic syndrome^s criteria.
- The limitations of the study should be mentioned.

The number of tables is high; please avoid repeating all the results of the tables in the text of the article.
