

# Review of: "The role of pH in cancer biology and its impact on cellular repair, tumor markers, tumor stages, isoenzymes, and therapeutics"

Siddharth Narayan

Potential competing interests: No potential competing interests to declare.

Overall the article is written well as a literature review which should usually be disclosed in the title itself but even as a literature review extra efforts should be taken to emphasise on the newer treatment modalities in cancer targetted therapies which will not hamper normal cell physiology. The current layout of the article reads as a chapter of a textbook and there is nothing gripping in the way its written to encourage reading the entire article. A simple way of keeping readers engages would be instead of summarising various theories and Hypothesis on the topic simply pick one singular hypothesis and expand on that alone in great depth. The reason why I suggest this is “before and after” reading this article my view on how pH is vital for physiological cell growth and functions and would thereby influence pathological changes such as that seen in cancer has not peaked at all. The whole purpose of an article in literature review is to summarise current level on knowledge on the topic (WHICH YOU HAVE ACHIEVED) as well is to increase curiosity or bring a spotlight on some flaw that can become someone elses dissertation (MISSING).
