

# Review of: "Sting Pathway Activation by Orally Administered Attenuated dsRNA Vaccine Virus for Therapy of Viral Diseases"

Lanjiao Wang

Potential competing interests: No potential competing interests to declare.

The author presents a promising strategy to inhibit multiple families of viruses, which will definitely be interesting for the control of viral diseases. In addition, the potential contribution of IBDV to existing cancer immunotherapies may benefit cancer research as well.

For me, there are a little bit too many keywords that may repeat information from the abstract. The introduction lacked information, such as the effectiveness and large use of chemical antivirals. The number of patients who participated was not mentioned during the clinical research. In the end, the conclusion may be too straightforward, which needs the support of more in vivo / clinical experiment data.
