Appreciate the authors; overall, this is a good paper. The authors present an interesting study on the antibacterial properties of *Anogeissus leiocarpus* against some phytopathogenic microorganisms. Analyzing the MS, I considered it important and relevant that this information be disclosed to the scientific community, since the topic seems relevant to me. However, I suggest that the MS should be improved and that it cannot be published in its present form. The MS suffers from numerous grammatical and scientific formatting errors. However, if the reviewers' points are addressed, I believe it can be published once the writing has been improved.

Being proactive with the MS, suggestions for improvement are outlined below; it is highly recommended that the writing be reviewed by an English language professional.

1. Recheck the bibliography and citations in the text.
2. Check the "et al." and scientific names; somewhere it is written in italics and on other sides in non-italics.
3. Need to update the references, and some authors in the bibliography are missing.
4. The presentation and format of tables and graphs must be improved.
5. The grammatical and formatting issues need to be addressed.
6. The form and style of scientific writing and how results are presented must be improved.
7. The abstract must be improved, considering how it should be articulated and highlighting the novelty of the information.
8. The methodology should explain more about the extraction procedures and how the MIC and MBC were performed, and establish the differences between each of them and under what principles they were used.
9. The discussion should be rethought and focused more on scientific terms, highlighting the findings and the scientific contribution, as well as pointing out the comparison with other similar studies carried out in phytomedicine.
