The review was fairly well written with the use of the latest scientific findings. However, some important information related to the role of mango on the immune system is missing.

1. Bioactive compounds in mango have a major role in the immune system, which has not been discussed extensively. It is also important to discuss the mechanism of major bioactive compounds found in mangoes in the immune system.
2. In the section "Recipes and Mango-Based Processed Foods for Immune Health", it is important to discuss the interaction of processed foods with the immune system. The impact of processing/preparation methods on immune health can be discussed extensively.
3. Adopting a correct scientific writing method is necessary to improve the quality of the review paper.
4. It is suggested to include appropriate diagrams, figures, etc. to increase the quality of the article (to illustrate the mechanisms, and structures of major bioactive compounds in mango)
