Potential competing interests: No potential competing interests to declare.

I enjoyed this article, which seeks to explain why there is something rather than nothing. However, I found it difficult to follow as this obtuse subject needs a very clear structure to present arguments. This was somewhat adopted in section 1.3 of the presentation and would be useful to clarify in the overview (abstract). Also, an introduction to the nature of the universe would make the arguments more meaningful. Frederico Faggin (*Director of the USA Foundation for Consciousness*) - the world renowned physicist who developed the micro chip which has changed the world - has recently published *Irriducibile la Coscienza La Vita i Computer C la Nostra Natura* (22). This presents the technical and natural world along with human beings, showing scientific rigour and vision about new connections from knowledge of mental functioning. Matter, stars, neutrons and planets as energy can undergo transition, according to physicists like the late Stephen Hawking, with his theories of black holes and Hawking radiation (HR). This is being revised to suggest that all objects with enough mass can be created by HR to suggest the whole universe could disappear. However, Quantum field theory says there is no such thing as an empty vacuum as space is teeming with vibrations and thus with energy. Faggin argues that as humans are energy with consciousness they will never cease to exist but just reform. Religion turns us into angels when our earthly form gives up! When we think of the universe it is mind boggling! The Milky Way's black hole (Sagittarius A*) has the mass of 4 million + suns!!

With more clarification of the universe as presently understood the arguments would be easier to follow. The article stopped abruptly and it would be good to produce a stronger review and reflection. Congratulations to the author for wrestling with this question which has foxed humans for centuries!
