**Potential competing interests:** No potential competing interests to declare.

- There are some grammatical errors, and language should be improved for better readability.
- Any abbreviated words should be capital in first letter (e.g., LDCs).
- Replicated title (*Power Cables and Tower: identity, values and worldview*).
- Rewrite new references to update references in the field of search.
- Rewrite section III (Switchyard: Family Actions) in organize format, e.g., bullets or complete paragraph.
- Resolution of images needs to be enhanced.
- Climate change may be mitigated by the simultaneous implementation of many strategies, so effectively reducing its effects, why do yo insists on wind turbines?
- Another important area that needs to be improved is the lack of clear proof about how the model can be used in real life. After the model has been put into use, it is important to do polls of groups of students or people who have used it. These polls should look at how the model changed the way people learned about climate change compared to people who didn't use the model. This method will make it possible to get a more complete and unbiased picture of how well the suggested model functions.

In general, the paper lacks a lot of technical discussion with no concrete novelty, and many grammatical errors.
