Potential competing interests: No potential competing interests to declare.

The study group is generous, so many result data could have been shown. Also, please, specify the Staging and grading of periodontitis, instead of moderate /severe periodontitis (see 2018 periodontitis classification).

Who has done the periodontal assessment? Were calibrated the examiners or not?

The discussion section could have been improved, because many recent studies are focussing on the influence of periodontitis on the cardiovascular pathology. This way, the authors could improve the references section, as well.
