Congenital stenosis or atresia of the coronary ostium

INSERM

Source

INSERM. (1999). *Orphanet: an online rare disease and orphan drug data base. Congenital stenosis or atresia of the coronary ostium. ORPHA:99087*

Congenital stenosis or atresia of the coronary ostium is a rare coronary artery congenital malformation characterized by congenital, partial or total occlusion of the left or right coronary artery orifice, associated with hypoplasia of the proximal segment of the corresponding coronary artery. It may present with failure to thrive, dyspnea, syncope, angina pectoris, ventricular tachycardia, myocardial ischemia and/or sudden death.
