Potential competing interests: No potential competing interests to declare.

1. The design of the experiment should be written in the abstract (the treatments and the animals that were used in the experiment) like (A, B, C, D, E, F, G and the number of animals in each replicate).
2. Surmising the results in the abstract the author can damage the result of some threats in one sentence for example all treaties that were increased should be written together and those that decreased together.
3. It will be better to write a short paragraph or some information on the effect of Florid on health and on the body in general in the introduction.
4. Write the details of treatments under the figures like (Group A=control. ... ect).
5. What is the age of rabbits? it isn't mentioned in the methods, that all rabbits used in the experiment were the same age.? Does age have any effect on the metabolism of the body for florid and yogurt?
