Review of: "Chelation Therapy for Rare Earth Element Toxicity: Current Evidence, Challenges, and Future Directions"

Asaad Babker¹

1. Gulf Medical University, United Arab Emirates

The study is thorough and excellently written overall. I have the following suggestions:

- Highlight critical gaps such as dose-response data, long-term effects, and biomonitoring markers explicitly. Suggest specific experimental approaches for future research to address these gaps.
- Summarize current and emerging chelators with comparative efficacy and safety profiles in tabular form.
