Review of: "Performance Evaluation and Analysis of Electric Vehicle Parameters – A Test Bench"

Ambarish Kulkarni[1]

1 Swinburne University of Technology

The paper provides an extensive insight into EV and its performance parameters. However, the contributions and novelty of the paper needs to be highlighted. The simulation models should be further validated to emphasise on the novelty. The research problem should be clearly articulated in the paper with extensive literature review to pinpoint the gaps in the industry. Replace all images with high resolution images and ensure units are added to relevant images. There is less emphasise on cloud based estimation. Explain the process involved and its applications. The conclusion should include quantitative results so that readers can clearly identify the results achieved through the research. It would be beneficial to mention about existing frameworks and highlight how the proposed system is superior or fill the gaps.
