Vibratory angioedema

INSERM

Source

INSERM. (1999). Orphanet: an online rare disease and orphan drug data base. Vibratory angioedema. ORPHA:493348

Vibratory angioedema is a rare, inherited or sporadic, urticaria characterized by localized, typically long-lasting (hours to days), initially pruritic, painful, normocutaneous or erythematous, mucosal and/or cutaneous edema which is triggered by vibration. Laryngeal snoring-induced swelling may be life-threatening.
