COG-C9710 APL Regimen

National Cancer Institute

Source

National Cancer Institute. *COG-C9710 APL Regimen*. NCI Thesaurus. Code C67480.

A regimen consisting of an induction phase with tretinoin (ATRA), cytarabine and idarubicin followed by a consolidation course of tretinoin and daunorubicin, used for the treatment of acute promyelocytic leukemia (APL). A prolonged maintenance regimen including tretinoin and methotrexate, with or without mercaptopurine (6-MP), is also part of the treatment plan.
