It is obvious that a lot of work has gone into this. Most of the data and conclusions drawn are consistent with reality. However, I couldn't find points about pregnant women in this script which I believe is one essential factor that also influences the acceptance rate of the vaccine. It is one reason why more men agree to take the vaccine than women. Some adverse effects seen after the immunization seems common among women than in men. I think these are things to also look at and have a more detailed journal. I love this work, it is excellent.
