Potential competing interests: No potential competing interests to declare.

A good article has been compiled. The abstract should be rewritten.

- The authors should clearly state the objectives of the study, including the specific goals of the proposed method and the analysis of the model's performance. This will help readers understand the purpose of the research.
- This article introduces the research of multiple scholars and explains their research methods. However, the literature section can emphasize the shortcomings of various methods, which is enough to shift to newly proposed methods.

The proposed method suggests adding more details.

- The tables should be analyzed more qualitatively in the Results and Discussion section.
- The experiments should be given more to show the effectiveness of the proposed method.
- What have been the limitations of your work?

The author's analysis of the selection of research methods is insufficient. Basically, the author directly explains what method to use in the main text, but the author does not explain why to choose this method.
