Potential competing interests: No potential competing interests to declare.

The title is very engaging, but when I get to the topic of COVID, it seems something that has been repeated a lot in other papers and it may be something irrelevant for most of teachers and students nowadays in terms of this paper is not going to help in something real inside of the classroom or online classrooms. anyway, it is always interesting to understand some topics related to the pandemic because in that way we could be more prepared for another big problem like this in the future. It's quite interesting to know that the data used comes from Twitter, because it's something very realistic from what people think about this topic and very connected to nowadays technology use.

Introduction: very clear, but it could be better if they are more specific about the accuracy they are talking about. The link from github is good, but all the content inside of it is not in english so it's not worthy if it is a worldwide paper.

Related Work: Very interesing research, very clear the self made table and interesting data, it can work as an example for future research in the field.

Method: The proposed sentimen analysis process is very clear shown in the figure.

Results and Discussion: Regarding the excellent graphics and all the data shown, I would have liked to read more connections between updated literature and the collected data, I think there is no reference to create a discussion between results and other literarure that could be related or could create an even stronger result.
