Review of: "Factors influencing women's decision choosing a public or private health facility for tuberculosis (TB) services: An analysis of Nepal demographic and health survey data 2016"

Emily Amondo

1. Authors should indicate why Nepal Demographic and Health Survey (NDHS) 2016 was preferred. Was it the most recent DHS in Nepal?

2. A comparative study including both men and women would have been informative rather than focusing only on women.

3. A map of the study area should be included

4. Briefly elaborate on the multi-stage sampling used by DHS

5. multivariate binary logistic regression equation should be included in write-up and explanation why it was preferred to probit equations

6. How was wealth quintile measure in NDHS computed? Based on income, consumption or assets? Give more elaboration.

7. Employed women were twice likely to select a public facility compared to unemployed while the wealthier the woman, the less likely she was to choose a public facility. What could be the explanation?

8. What specific policy recommendations would you suggest to increase access of women to public health facility. This is not clear in the paper
