Potential competing interests: No potential competing interests to declare.

The article brings important aspects about the study of metals in Debrecen's topsoil. The work is well written, and the results are properly described. Some figures were very small or had low resolution, which made it difficult to understand the information described in them.

It is worth describing why these elements were chosen for characterization. Are there any possible sources in the area? What would be their origins? This must also be corroborated in the discussion of the results.
