Potential competing interests: No potential competing interests to declare.

This study investigates the effects of medical nutrition therapy on the monocyte-to-lymphocyte ratio, neutrophil-to-lymphocyte ratio, and prognostic nutritional index in hospitalized pulmonary tuberculosis patients. There are a few points I want to mention. There is no control group in the study. Adding comparative analyses with the control group would strengthen the conclusions. It would be good to give a more detailed analysis of macronutrient and micronutrient intake and demographic characteristics. I recommend that the materials, methods, and limitations sections be given in more detail.
