**Potential competing interests:** No potential competing interests to declare.

Firstly, the topic is very interesting, but the manuscript needs to be revised.

The abstract was written by AI (100%).

The gap in this study is to know the prevalence and the associated factors, not the awareness, as mentioned in the last paragraph of the introduction

“Overall, the population was estimated to be 2,381,079 people, with 1,166,729 males” – you should mention the total number of welders

The sample size is determined by what?

The sample size is 424 or 634 welders.

The discussion needs to be revised.

In the discussion, you should write about the strength of the study as well as the weaknesses.

Add implications of the study.
