Potential competing interests: The author(s) declared that no potential competing interests exist.

Firstly, I think the author(s) took an original viewpoint on the study, and the contributions are somewhat different from past studies. The manuscript is comprehensible even for non-native readers. However, I do struggle a bit in comprehending the analyses. I noted the mix of data scales, some are ordinals, and some are intervals. As I am no statistician, and some readers might be the same, I suggest that the author clearly separates the analyses for each type of data. Nevertheless, I think the quality of the paper is good, with appropriate arguments and justifications.
