

# Review of: "Comment on "On the linearity of the generalized Lorentz transformation""

F. L. Carneiro

Potential competing interests: No potential competing interests to declare.

The subject of Lorentz transformations is very interesting, as a set of frame transformations can characterize a theory. The paper is comprehensive and addresses a relevant topic but appears to comment on Ref. [1]. Without reading Ref. [1], the main objective of the article is vague, e.g., the meaning of equations (6) and (7) is not clear. I believe that the author should introduce at least a brief comment on the significance of these equations of Ref. [1] and discuss on Ref. [1] itself.
