Potential competing interests: No potential competing interests to declare.

1. Please rewrite the abstract of the manuscript. The novel findings of research are missing from the abstract of the article.
2. The structure of the introduction is haphazardly written in the manuscript. There is a lot of irrelevant information in the manuscript. The current representation of the introduction is complex, making it difficult to understand the idea behind the research and its novel impact on the agricultural industry.
3. Why do the authors use only the NDVI index for monitoring? Other indices, such as SAVI, EVI, etc., are available to monitor the vegetation. So, the analysis of maize prediction needs to be clarified.
4. More details about the regression model are required for better understanding.
