Potential competing interests: No potential competing interests to declare.

1. The title should be modified to "COVID-19:**Mental** health risk factors among students' ...", as the survey focused on mental health problems only.
2. The sample size is relatively small for such a "prevalence study". The authors need to justify why was that, especially the data collection was electronic.
3. No need to know about the response rate for each question of the demographic characteristics and anxiety/depression symptoms. The "overall" response rate (which I couldn't find) would be enough.
4. The authors have to clarify why is this "bizarre" difference regarding the participation of females and males (95% versus 5%).
5. The tables are too many, and a bit confusing. I recommend that the authors re-construct the tables by merging some of the similar categories, and make it more self-explanatory rather than copying it directly from the statistical program.
6. The discussion is mostly a repetition of results, it needs more "discussion" and interpretation.
